Objective
System design
Beamline integration
Project status
HDF5 & NeXus for metadata

Background

Ojective:

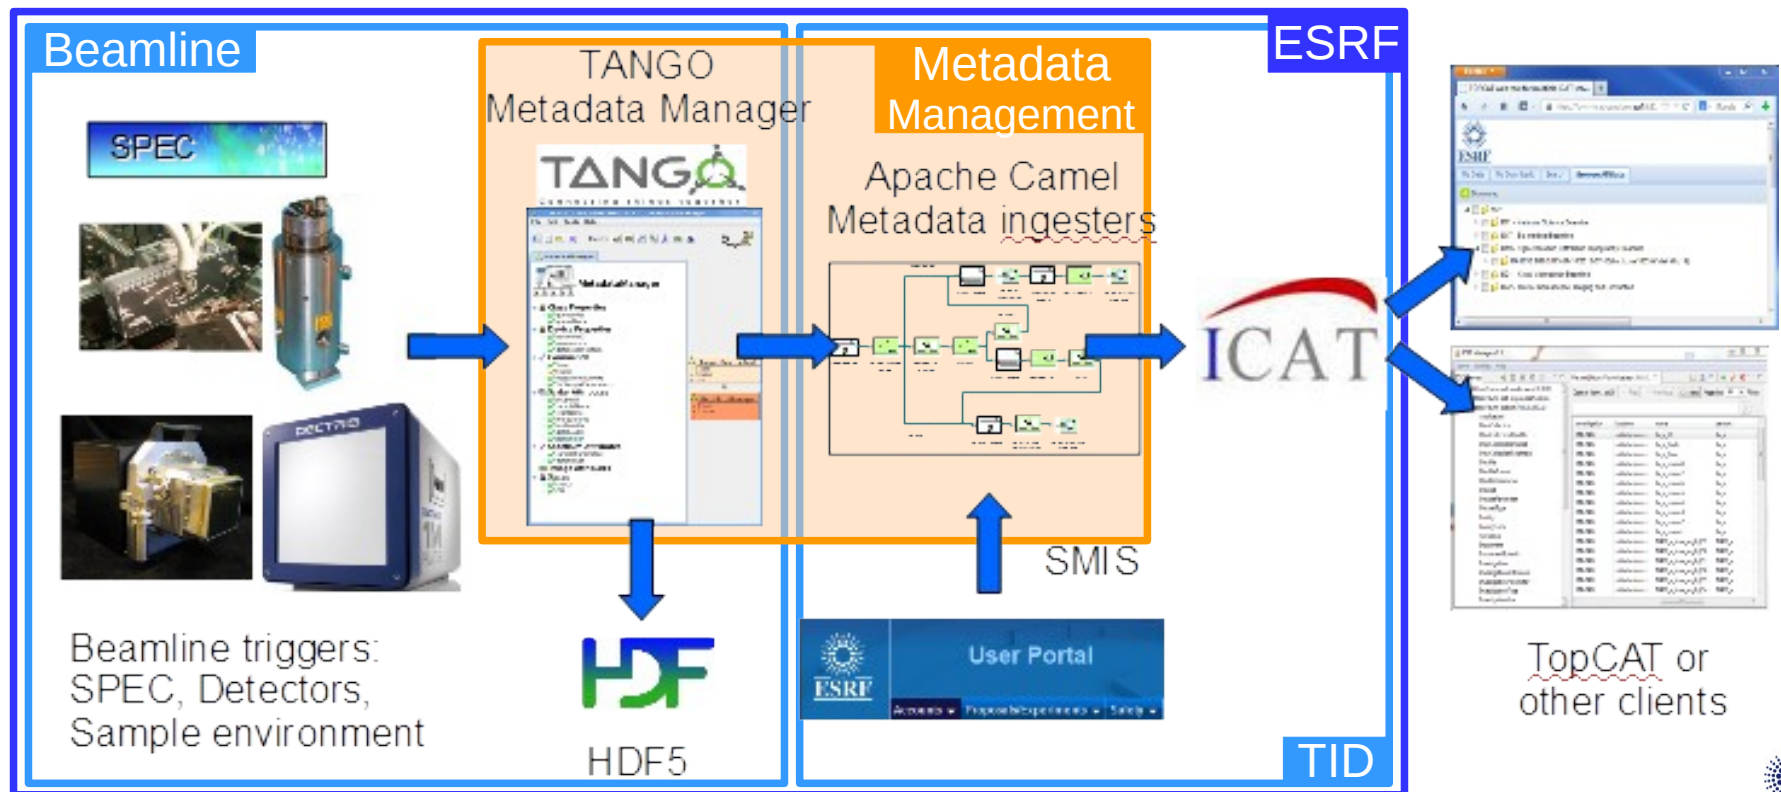

Design and implement a solution for gathering generic and specific metadata on all beamlines at the ESRF, store it in a database and make it available to users for browsing, searching and data analysis locally and remotely via a web browser.

Metadata catalogue: ICAT

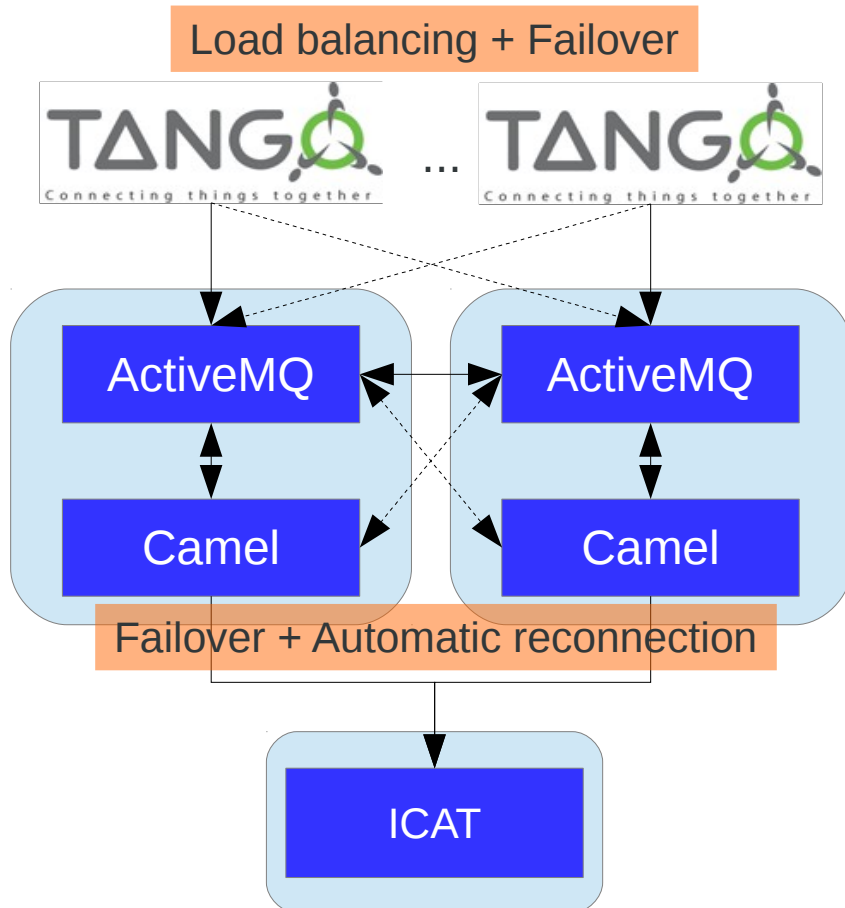

General system design

- Stateful Tango device on each beamline to collect metadata
 - Metadata stored in local HDF5 file and sent to registration queue
- Stateless queuing and processing system
 - Retrieves additional metadata from SMIS (users, title)
 - Format and stores all metadata in ICAT (incl. access rights)

Queuing system: JMS – Apache ActiveMQ

- Queues act as buffers in case of peak activity or slow process
- Integrity: message acknowledgement, persistence, transactions, failover
- Scalability: concurrent access, load balancing, network of brokers

Admin console – Hawtio

- Web access to JMX through Jolokia JVM agent
- System monitoring (memory, disk, cpu, threads, logs)
- Route management (start / stop / pause / create new / modify existing)

The screenshot displays the Hawtio Admin console interface. The top navigation bar includes 'Container', 'Camel', 'Dashboard', 'JMX', 'Logs', and 'Threads'. The 'Camel' tab is active, showing a list of Camel contexts and routes. The left sidebar shows a tree view of Camel contexts, with 'camel' expanded and 'Routes' selected. The main area displays a table of routes with columns for State, Context, Route, Completed #, Failed #, Failed Handled #, Total #, Inflight #, Mean Time, Min Time, and Max Time. The table lists 12 routes, with 'MESSAGE-ROUTER' highlighted in blue. Above the table are buttons for Start, Pause, Stop, and Delete, and a search filter.

Tango device

- Where to send the metadata
 - PyTango ↔ JMS using STOMP
- What to send
 - Beamline configuration
 - Configurable metadata
- When to send
 - StartScan
 - EndScan / AbortScan
- Mandatory metadata
 - Proposal
 - Sample
 - Scan name
- States

Tango device configuration

- Parameters used as metadata are defined in the “parameters” property.
- Each parameter is used to define a dynamic attribute on the device, either:
 - A remote attribute, to read from another device:
SR_Current = orion:10000/fe/id/16/SR_Current
 - A single array element of a remote attribute:
param = id16na/device/attribute[0]
 - A list of remote attributes to concatenate:
*optics_positions = id16na/spec/dmir_zz/position,
id16na/spec/mtz/position, id16na/spec/mty/position*
 - (TangoSpec motors and variables)*
 - A single element of a Spec associative array (through TangoSpec)
param = id16na/spec/spec/FTOMO_PAR[param]
 - A local attribute that needs to be set on that device:
scanType
- Dates are collected automatically:
startDate when you StartScan, endDate when you EndScan

Beamline integration

- **Device installation**
 - Since version 1.2 standard blissinstaller (src install, no dependencies)
 - (TangoSpec installation and configuration if needed)
 - MetaExperiment: single device for proposal and sample definition
 - MetadataManager: configure several classes if the beamline runs very distinct experiments (ID16A: fluo vs. tomo)
- **Device configuration**
 - Each MetadataManager class has a single device with its own configuration, defining which parameters to register and from where
 - Manual configuration of parameters is tedious → Configuration GUI
- **Control system integration**
 - Set proposal, sample and scan name
 - Data folder (from or to device)
 - Calls to StartScan and EndScan

Example integration – ID16A

- **Our first client !**
 - Device installation done by me (1 device for tomo, 1 for fluo)
 - Device configuration and integration with spec done by P. Cloetens
 - Integration with GUI done by V. Valls
- **Configuration details:**
 - Storage ring parameters

```
machineMode = orion:10000/fe/id/16/SR_Filling_Mode
SR_Current = orion:10000/fe/id/16/SR_Current
insertionDeviceName
insertionDeviceGap = orion:10000/id/id/16ni/U18-3C_GAP_Position,
                    orion:10000/id/id/16ni/U18-3D_GAP_Position
```

- Beamline parameters

```
energy = id16ni/energy/master/position
monochromatorName = id16ni/energy/multilayer/positionId
filter = id16ni/attenuator/1/positionId, id16ni/attenuator/2/positionId,
        id16ni/attenuator/3/positionId
optics_sensors_labels
optics_sensors_values = id16ni/experiment-wago/kb/kb1_hmth,
                        id16ni/experiment-wago/kb/kb1_vmth, id16ni/experiment-wago/kb/kb1_rx,
                        id16ni/experiment-wago/kb/kb1_tx
```

Example integration – ID16A cont.

- Sample parameters

sample_motors

```
sample_positions = id16ni/motor/srot/position, id16ni/motor/sx/position,  
id16ni/motor/sy/position, id16ni/tripod/sample/zc,  
id16ni/motor/spy/position, id16ni/motor/spz/position,  
id16ni/motor/su/position, id16ni/motor/sv/position,  
id16ni/tripod/sample/pitch, id16ni/tripod/sample/roll,  
id16ni/tripod/frame/zc, id16ni/tripod/frame/pitch,  
id16ni/tripod/frame/roll
```

vacuum_labels

```
vacuum_values = id16ni/v-pen/111/pressure
```

- Tomography parameters

```
dark_N = id16ni/spec/zaptomo/DARK_N
```

```
ref_On = id16ni/spec/zaptomo/REF_ON
```

```
ref_N = id16ni/spec/zaptomo/REF_N
```

```
tomo_N = id16ni/spec/zaptomo/TOMO_N
```

```
y_Step = id16ni/spec/zaptomo/Y_STEP
```

- Other parameters

scanType

```
ccdtime = id16ni/spec/zaptomo/TOMO_EXPTIME
```

```
pixelSize = id16ni/ImagePixelSize/frelon1/pixelWidth
```

Example run - Experiment

- When experiment is started, spec/GUI calls StartScan
 - Start time recorded
 - Remote attributes read asynchronously
 - hdf5 file created with snapshot of parameter values
- When experiment ends, spec/GUI calls EndScan
 - End time recorded
 - Remote attributes read again
 - hdf5 file appended with snapshot of parameter values
 - XML message sent to queue
- If user abort the scan → AbortScan
Nothing is registered
- If user aborts the scan but want to keep the data → InterruptScan
Same as EndScan but dataset flagged as incomplete

Example run – Behind the scene

- ActiveMQ receives the XML message
 - It is first stored locally and acknowledged
 - System verifies that the proposal exists
 - Data files are listed from data folder
 - Registration in ICAT
 - Dataset
 - Sample
 - Parameters
 - Datafiles
 - Registration feedback to beamline and admins

A few seconds after the end of the scan, users and beamline scientists can log in ICAT with their standard credentials, browse their datasets and the associated metadata, download the data and the metadata, all from a web browser.

Feedback from the ingestion process

Investigation Details

Facility: European Synchrotron Radiation Facility

Instrument: ID16A - Nano-Imaging

Title: ls2366

Investigation No: LS-2366

Visit Id: id16a

Start Date: 11/19/14 8:26 AM

End Date: 11/26/14 4:18 PM

Investigators: Scientist - STEPHANE ROUDEAU
Scientist - laura PERRIN-VERDUGIER
Principal investigator - Richard ORTEGA
Local contact - Yang Yang

Proposal:

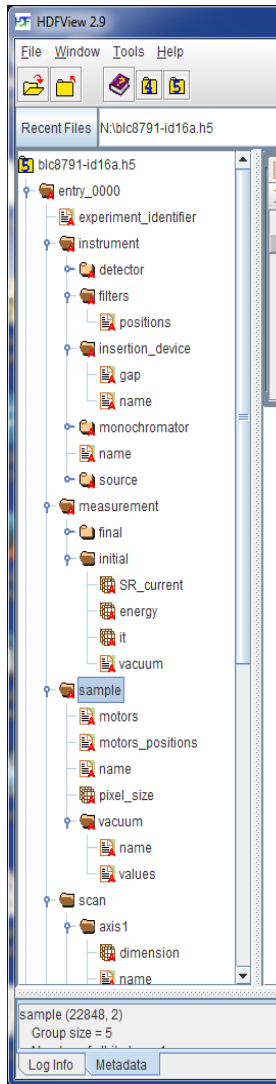

How it looks in the hdf5 file

The screenshot displays the HDFView 2.9 interface. On the left, a tree view shows the file structure for 'blc8791-id16a.h5'. The tree includes nodes for 'entry_0000', 'instrument', 'detector', 'filters', 'positions', 'insertion_device', 'gap', 'name', 'monochromator', 'source', 'measurement', 'final', 'initial', 'SR_current', 'energy', 'it', 'vacuum', 'sample', 'motors', 'motors_positions', 'name', 'pixel_size', 'vacuum', 'name', 'values', 'scan', 'axis1', 'dimension', and 'name'. Blue arrows point from specific nodes in the tree to corresponding data views on the right:

- 'experiment_identifier' points to a 'TextView - experiment_identifie...' window showing 'blc8791'.
- 'positions' points to a 'TextView - positions - /entry_0000/instrument/fil...' window showing 'bpm1 out out'.
- 'SR_current' points to a 'TableView - SR_current - /entry_0000/measurement/in...' window showing a table with values 0 and 195.78.
- 'vacuum' points to a 'TextView - name - /entry_0000/sample/vacuum/ - blc8791-id1...' window showing 'Sample_chamber'.
- 'values' points to a 'TextView - values - /entry_0000/sample/vacuum/ - blc8791...' window showing a table with values 0 and 1.20e-07.

The bottom status bar indicates 'sample (22848, 2)' and 'Group size = 5'. The bottom left corner shows 'Log Info' and 'Metadata' tabs.

HDF5Export script

- python-icat script + bash script
- 'HDF5Export cleva MA-2240 newfile.hdf5'
 - Asks for password
 - Connects to ICAT
 - Retrieves all Datasets for Investigation MA-2240
 - Uses same HDF5Writer than Tango device
 - Export 1 hdf5 entry for each dataset in the file
 - Each entry has the format defined previously
- Allows beamline scientists to recreate on the fly an experiment summary
 - If original is lost
 - If hdf5 format changed

Beamline configuration from HDF5 format

- Users select (groups of) parameters they want to register
- They assign device attributes to the selected parameters

The image displays two software interfaces used for beamline configuration and control.

Beamline Configurator (Top): This window shows the configuration of parameters for an entry, instrument, and source. The left pane lists parameters to be registered, such as `experiment_identifier`, `instrument`, `name`, and `source`. The right pane shows the configuration for the selected instrument, including `name` and `source` parameters.

LineControl (Bottom): This window provides a detailed view of the beamline configuration and control. The top section shows the **Overview** tab, which displays the current status of the beamline (Current: -0.10) and the **Vacuum** and **Alignment** tabs. The main area shows a schematic diagram of the beamline, including components like the **Safety Shutter**, **Primary Slits**, **Secondary Source**, **Secondary Slits**, **Fast Shutter**, **KB**, **Beam viewers**, **Energy**, **Primary slits**, **Attenuators**, **Cleaning slits**, **Feedback**, **Secondary source**, **Secondary slits**, **Fast shutter**, and **KB**.

The bottom section of LineControl shows the **Beam viewers** and **Energy** tabs, which provide detailed information about the beamline components and their status. The **Beam viewers** tab shows the status of various beamline components, including **bpm1**, **bpm2**, **bpm3 4q**, **bpm4**, **bpm5**, **bpm6**, **bpm6 diode-t**, and **vlm**. The **Energy** tab shows the status of the **Keithley diode** and **Attenuator 1**.

Project roadmap - past

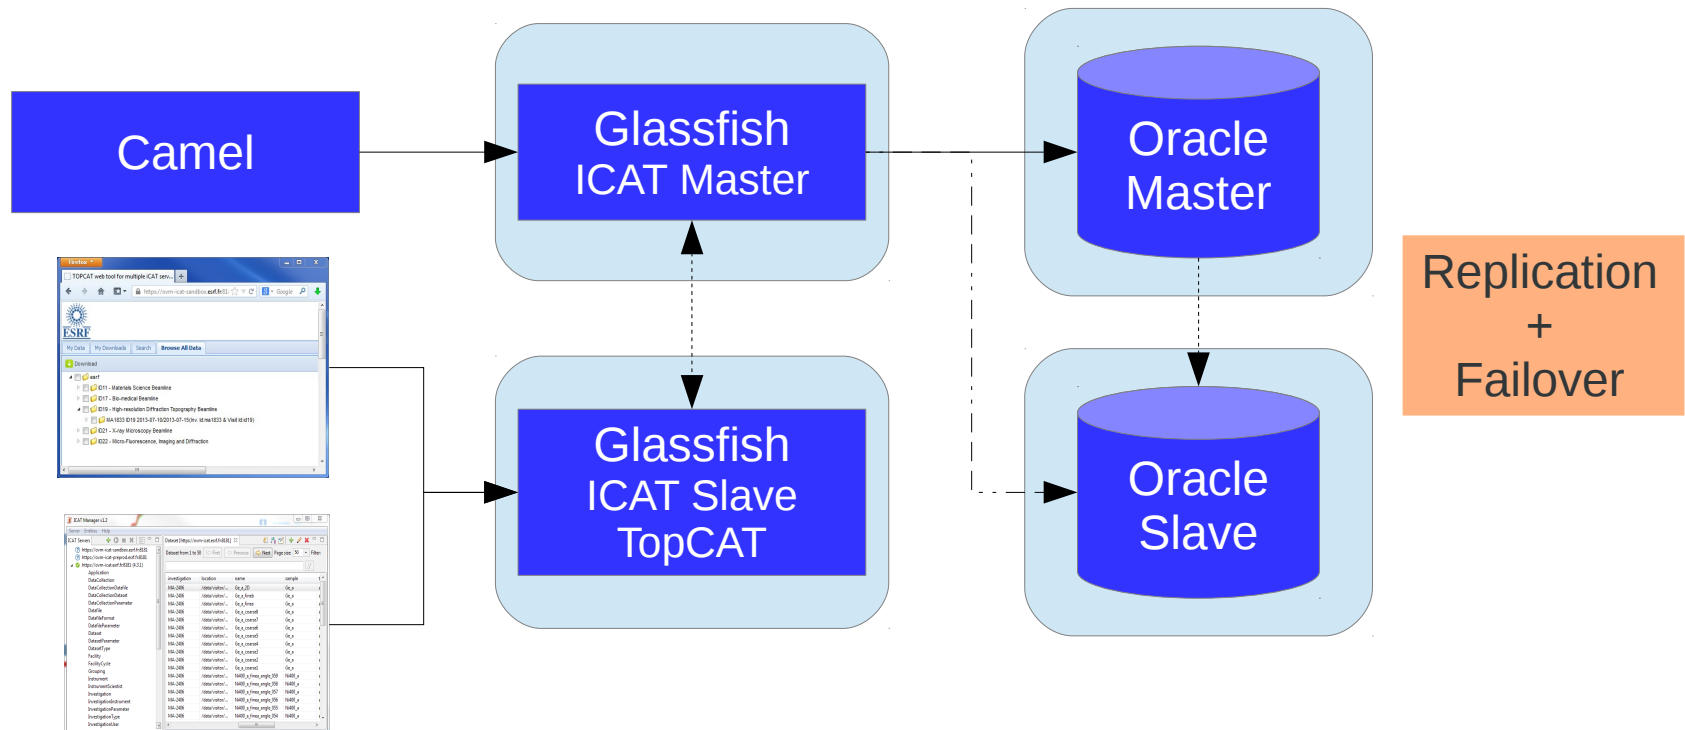

- **Started on the project October 2013**
 - Installation of ICAT, database, TopCAT + other modules
 - Finalization of pilot project
- **Initial tests with Camel started February 2014**
 - Development started March 2014
 - Discussion with ID16A scientists started Mai 2014
 - Initial test version June 2014
 - Modifications based on scientists feedback and initial testing
- **First production release end August 2014**
 - Integration and configuration for ID16A
- **First automatic metadata registration 30 September 2014**
 - BLC-8617 then LS-2307
- **Current version 1.5**

Status of integration

- **ID16A:**
 - Installed, configured and integrated to spec and GUI
 - Running for all experiments (incl. BLC and IH) since 2014/09/30
- **ID17:**
 - Installed, configured and integrated to spec and GUI
 - Running for MRT experiments since 2015/02/02
- **ID16B:**
 - Installed and configured
 - Integration on-hold
- **ID01:**
 - Installed
 - Configuration, integration and testing ongoing
- **ID06:**
 - Installed
 - Configuration, integration and testing ongoing

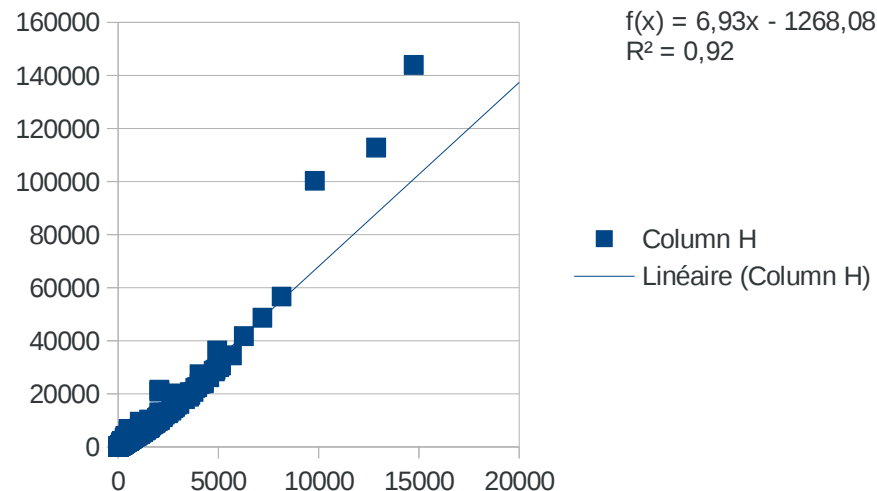

Project roadmap - future

- Things remaining to do:
 - Record processing step in addition to acquisition
 - Update backend (ICAT, TopCAT, IDS)
 - Improve installation of ICAT (WS + DB)

Registration statistics

- In 13 weeks of operation on ID16A (as of 2015/02/11):
 - 19 proposals,
 - 69 users,
 - 139 samples,
 - 1917 datasets,
 - 55 172 parameters,
 - 1 807 096 datafiles registered
- Average registration time: 8.3 s / dataset

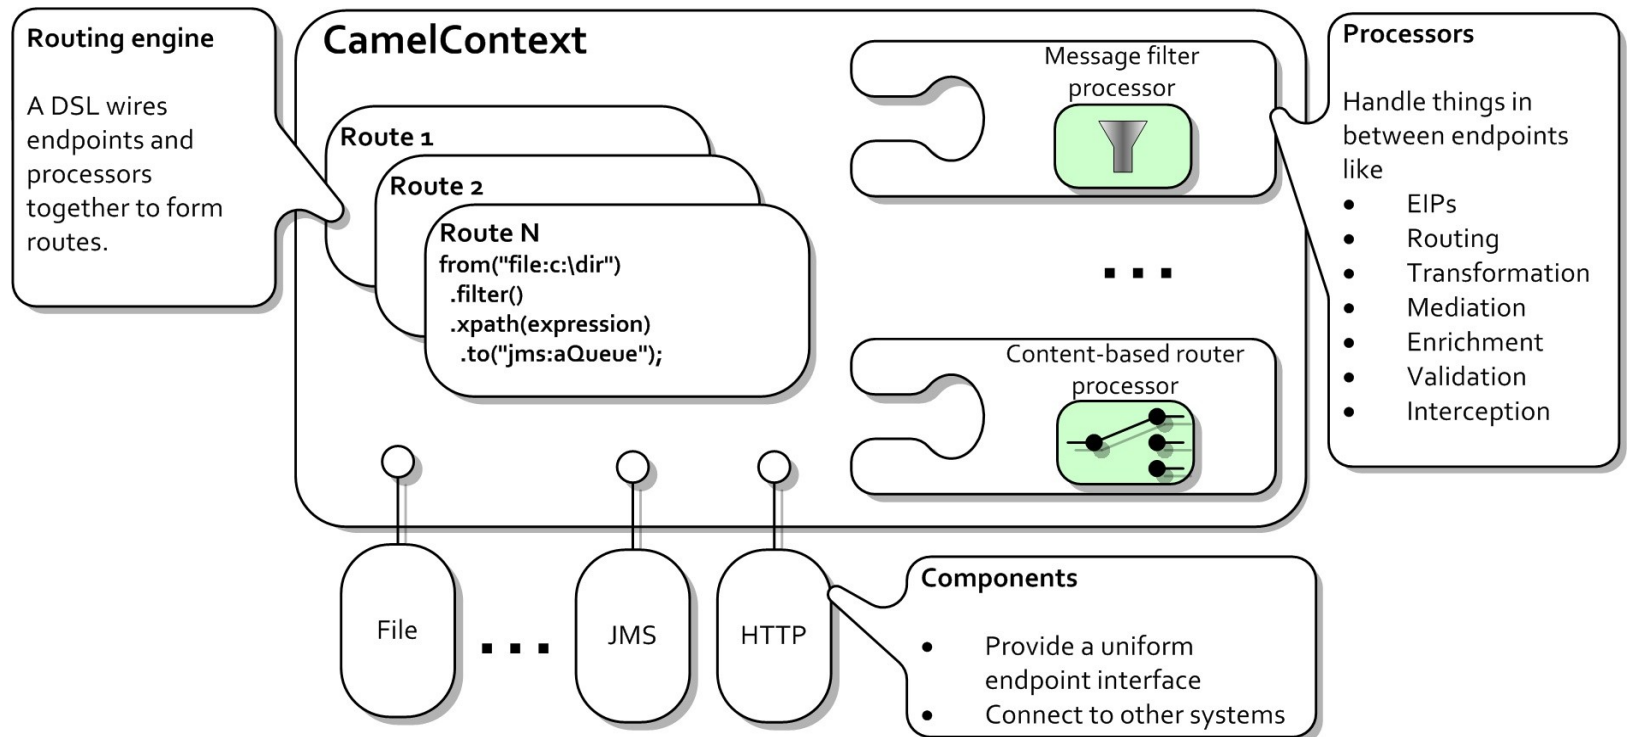

| The European Synchrotron

Thank you for your attention

What is Camel ? (from <http://java.dzone.com/articles/open-source-integration-apache>)

Apache Camel is an open source Java framework that focuses on making integration easier and more accessible to developers. It does this by providing:

- Concrete implementations of the widely used Enterprise Integration Patterns
- Connectivity to a great variety of transports and APIs
- Domain Specific Languages (DSLs) to wire EIPs and transports together

Advantages of using Apache Camel

Most features already implemented

- ✓ Concurrent processing, thread pools, pooled connections
- ✓ Support transactions out of the box
- ✓ Automatic message translation (marshall/unmarshall, conversion)
 > 30 data format recognized & > 170 converters out of the box
- ✓ Configurable error handler, redelivery policy, logging and tracing

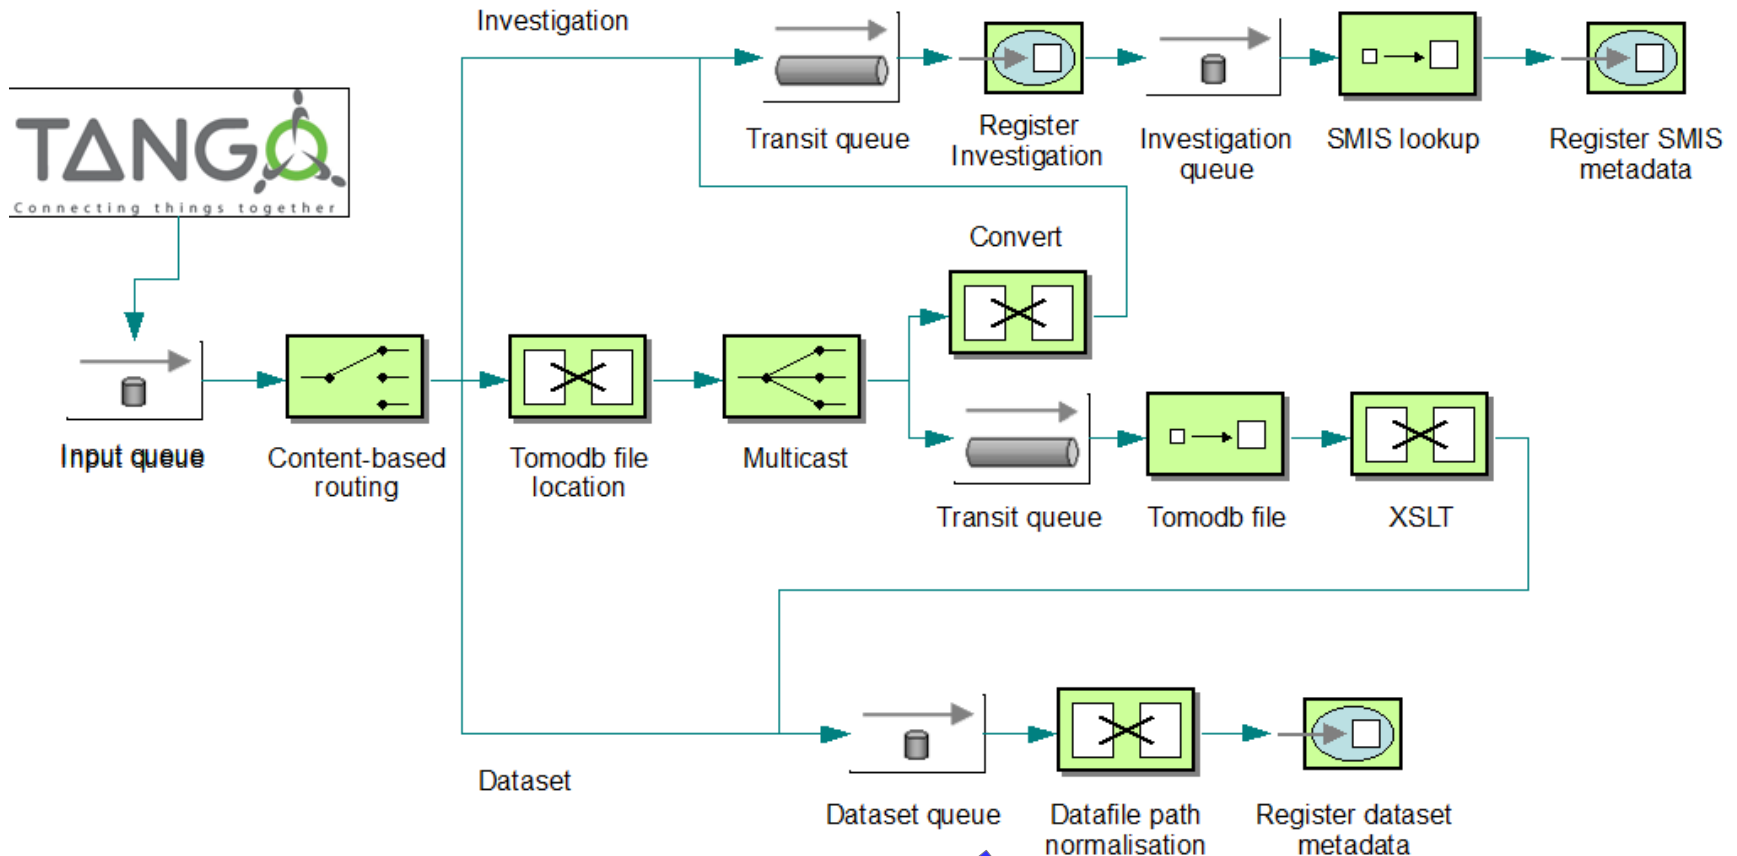

Technology agnostic

- ✓ Implements well-defined Enterprise Integration Patterns
- ✓ Independent of queuing system, transport technology, ...

Very well integrated

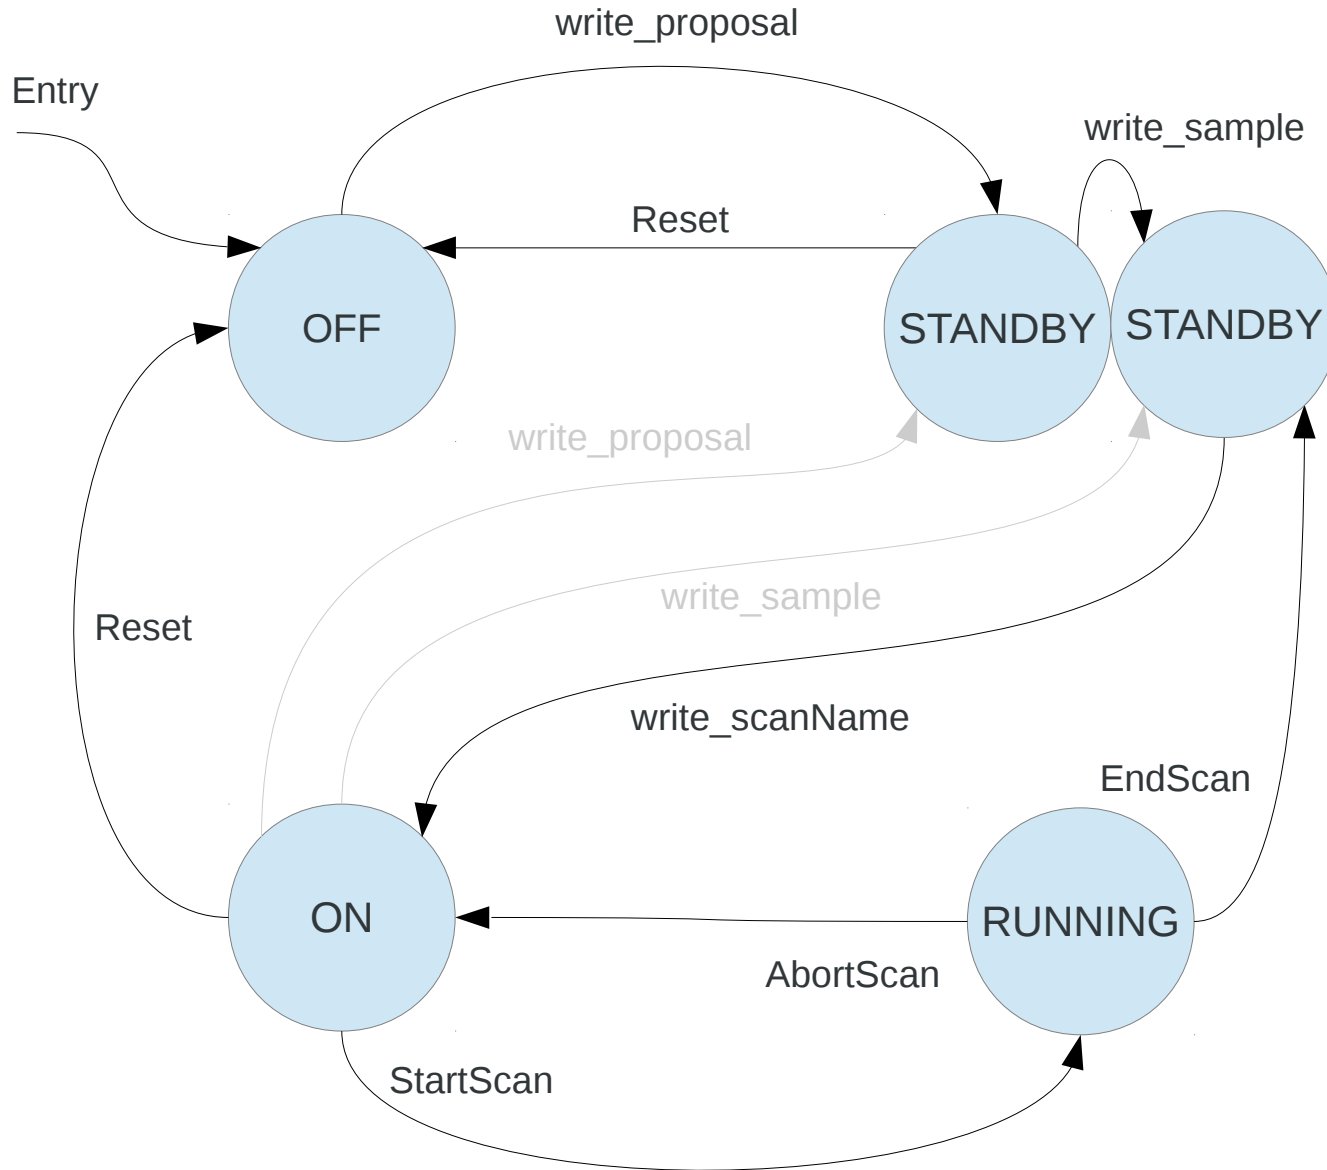

- ✓ Over 170 existing components, integration of Beans and POJO
- ✓ DSL for Java, Spring, Scala, Groovy, Annotations, Blueprint, ...
- ✓ Options for deployment (standalone, EJB container, OSGi container)
- ✓ Pure Maven (archetypes, plugins), JUnit support, Spring integration

Processing details

```

Example integration – ID16A cont.

- **Spec integration:**

“ Normally for a fluorescence scan/map we use the macro zapimage, that calls the macro function `_zapscan`.

I replaced it by a macro fluoimage that still calls `_zapscan`

+ takes care of opening/closing the X-ray shutter

+ takes care of saving in a way consistent with the database

+ interacts with the metadata system

It made life much, much easier with the two first user groups.

The way we work is as follows:

- Local contact sets the proposal through the DS id16ni/metadata/experiment
- User sets the sampleName through the Acquisition GUI (talking to the MetadataManager) when the sample is changed
- User sets the scanName either with the Acquisition GUI or the spec macro `set_scanname` (for sequencing maps, both talking to the MetadataManager)
- User selects the map to grab/resolution etc. with the Acquisition GUI, this results in a spec command "fluoimage" ... "

P. Cloetens 2014/10/16

Example run - Preparation

- Local contact sets the proposal
 - Investigation created in ICAT
 - Proposal details and access rights fetched from SMIS
 - Investigation updated in ICAT
 - (Local contact sets the dataRoot for non standard proposal: BLC, IH, test)
 - User sets the sample name
 - User sets the scan name (must be unique for the proposal), then either
 - Device builds data folder path according to the configured pattern:
`{dataRoot}/{proposal}/{beamlineID}/{sampleName}/{scanName}`
`/data/visitor/ls2307/id16a/sample_s1/sample_s1_scan_1`
`(/data/id16a/inhouse1/commissioning/blc8499/id16a/sample_s1/scan_1)`
 - User/system sets the data folder path to his liking
- No verification at all

Current (last) development

- **How to help configure the device on beamlines, ensure all ICAT parameters are mapped into the hdf5 files and the files follow NeXus format ?**
 - Build the hdf5 configuration from NeXus definitions
 - Assign ICAT parameters to NeXus fields/groups
 - Verify all ICAT parameters have a defined position in the file and all groups and fields are properly set
 - Select (groups of) parameters for use on the beamline from the hdf5 configuration
 - Assign Tango attributes to all selected parameter (automatically if possible: slits, insertion devices, others ?)
- **This way we have:**
 - Consistent configurations across ICAT, hdf5, beamlines
 - Consistent conversion ICAT ↔ hdf5
 - Easy way to configure hdf5 format AND devices on beamlines
